Experiment Title:
Program on Multithreading

WAJP to print the table of 5,7,13 using Multithreading (Use thread class)

Code:

```
1  class PrintTables extends Thread
2  {
3    int num;
4    public PrintTables(int num)
5    {
6      super("Table" + num);
7      this.num = num;
8    }
9    public void run()
10   {
11     for(int i = 1; i <= 10; i++)
12     {
13       System.out.println(num + "*"+ i + ": " + num * i);
14     }
15   }
16 }
17 class Tables
18 {
19   public static void main(String args[])
20   {
21     PrintTables  t5 = new PrintTables(5);
22     PrintTables  t7 = new PrintTables(7);
23     PrintTables  t13 = new PrintTables(13);
24
25     t5.start();
26     t7.start();
27     t13.start();
28
29     try
30     {
31       t5.join();
32       t7.join();
33       t13.join();
34     }
35     catch(InterruptedException e)
36     {
37       System.out.println(e);
38     }
39   }
40 }
```

Ouput:

```
5*1:  5
5*2:  10
13*1:  13
7*1:  7
13*2:  26
5*3:  15
5*4:  20
13*3:  39
13*4:  52
7*2:  14
13*5:  65
13*6:  78
13*7:  91
13*8:  104
13*9:  117
5*5:  25

7*7:  49
7*8:  56
7*9:  63
7*10:  70
```

WAJP to print first 20 prime nos. and 15 Fibonacci terms. (Using Runnable Interface)

Code:

```
1  class PrintPrimes implements Runnable
2  {
3    Thread t;
4    int noOfElements;
5    public PrintPrimes(int noOfElements)
6    {
7      t = new Thread(this, "print primes");
8      this.noOfElements = noOfElements;
9      t.start();
10   }
11   public void run()
12   {
13     int i = 1;
14     int num = 2;
15     boolean isPrime = true;
16     while( i <= noOfElements)
17     {
18       for(int j = 2; j <= num / 2; j++)
19       {
20         if( num % j == 0)
21         {
22           isPrime = false;
23           break;
24         }
25       }
26       if(isPrime)
27       {
28         System.out.println( "Prime No. " + num + "   ( "+ i +" )");
29         i++;
30       }
31       isPrime = true;
32       num++;
33     }
34   }
35 }
36 class PrintFibo implements Runnable
37 {
38   Thread t;
39   int noOfElements;
40   public PrintFibo(int noOfElements)
41   {
42     t = new Thread(this, "print fibos");
```

```java
43         this.noOfElements = noOfElements;
44         t.start();
45      }
46      public void run()
47      {
48         int a = 0;
49         int b = 1;
50         for(int i = 1; i <= noOfElements; i++)
51         {
52            System.out.println("Fibo term "+ i + ": " + a);
53            b = a + b;
54            a = b - a;
55         }
56      }
57 }
58
59 class PrimeAndFibo
60 {
61    public static void main(String args[])
62    {
63       PrintPrimes prPrimes = new PrintPrimes(20);
64       PrintFibo prFibos = new PrintFibo(15);
65       try
66       {
67          prPrimes.t.join();
68          prFibos.t.join();
69       }
70       catch(InterruptedException e)
71       {
72          System.out.println(e);
73       }
74
75    }
76 }
```

Program on concept of synchronization
Code:

```
 1  class Account
 2  {
 3      int balance;
 4      public Account(int balance)
 5      {
 6          this.balance = balance;
 7      }
 8      public void deposit(int value)
 9      {
10          balance = balance + value;
11      }
12      public void withdraw(int value)
13      {
14          if(balance - value < 0)
15          {
16              System.out.println("Cannot Withdraw");
17          }
18          else
19          {
20              balance = balance - value;
21          }
22      }
23      public void depositTimes(int value, int times)
24      {
25          for(int i = 0; i < times; i++)
26          {
27              deposit(value);
28              System.out.println("Balance: " + balance);
29          }
30      }
31
32      public void withdrawTimes(int value, int times)
33      {
34          for(int i = 0; i < times; i++)
35          {
36              withdraw(value);
37              System.out.println("Balance: " + balance);
38          }
39      }
40  }
41  class ATM implements Runnable
42  {
43      Account ac;
44      Thread t;
```

```
45    public ATM(Account ac)
46    {
47        t = new Thread(this, "ATM");
48        this.ac = ac;
49    }
50    public void run()
51    {
52        ac.withdrawTimes(500, 10);
53    }
54 }
55 class Bank implements Runnable
56 {
57    Account ac;
58    Thread t;
59    public Bank(Account ac)
60    {
61        t = new Thread(this, "Bank");
62        this.ac = ac;
63    }
64    public void run()
65    {
66        ac.depositTimes(500, 10);
67    }
68 }
69 class SynchronizationIssue
70 {
71    public static void main(String args[])
72    {
73        Account ac = new Account(500);
74        Bank bank = new Bank(ac);
75        ATM atm = new ATM(ac);
76        bank.t.start();
77        atm.t.start();
78        try
79        {
80            bank.t.join();
81            atm.t.join();
82        }
83        catch(InterruptedException e)
84        {
85            System.out.println(e);
86        }
87    }
88 }
```

If we make the functions operating on the shared data synchronized then only one thread will be able to access it at once Thus all the withdraws will occur after all the deposits

Code:

```java
1  class Account
2  {
3      int balance;
4      public Account(int balance)
5      {
6          this.balance = balance;
7      }
8      synchronized public void deposit(int value)
9      {
10         balance = balance + value;
11     }
12     synchronized public void withdraw(int value)
13     {
14         if(balance - value < 0)
15         {
16             System.out.println("Cannot Withdraw");
17         }
18         balance = balance - value;
19     }
20 }
```
